

## **Chapter 3 - Moles, Atoms, Mass Percents and Stoichiometry**

### **Section 2 - Mass Percent and Empirical Formula**

*Dr. Sapna Gupta*

1

### **Introduction**

Chemical compounds are represented as formulas. One way of knowing the formula for ionic compounds is by looking at the valencies. But as we learned in the nomenclature of covalent compounds there can be more than one compound of the two elements, e.g. NO and NO<sub>3</sub> or CO and CO<sub>2</sub>. How do we determine the formulas for these compounds?

For this we need to learn about mass percents and then learn how we can use instrumentation to calculate the formulas of ionic and covalent compounds.

2

## Chemical Formulas

- 1) Empirical Formula - Is the lowest ratio of combination of elements e.g. H<sub>2</sub>O, CH<sub>2</sub>O.
- 2) Molecular Formula - The actual ratio of elements in a compound. Generally, for ionic compounds the empirical formula is also the molecular formula (formula unit).

E.g. H<sub>2</sub>O<sub>2</sub> is molecular formula and HO is the empirical formula.

In some covalent compounds the empirical formula has to be multiplied by an integer to give the molecular formula.

E.g. (CH<sub>2</sub>O) x 6 = C<sub>6</sub>H<sub>12</sub>O<sub>6</sub> (glucose)

- 3) Structural Formula - This is the 3D representation of the ionic or covalent compound.

3

## Mass Percent

- In a compound there can be two or more elements. In mass percent calculations we calculate the mass percent of each element in that compound.
- This type of calculation is important in finding how much element might be contributing to the total mass of the compound.
- To do these calculations we first find the total mass of the compound and then find the mass of each of the elements in the compound.

$$\% \text{ mass of an element} = \frac{\text{mols of element} \times \text{at. mass of element}}{\text{molar mass of the compound}} \times 100\%$$

Try to look at each compound in terms of mols. This will help you in future calculations.

For e.g. in Na<sub>2</sub>CO<sub>3</sub> - there are 2 mols of sodium, 1 mol of carbon and 3 mols of oxygen.

**Solved Problem: Mass percent**

Silver chromate,  $\text{Ag}_2\text{CrO}_4$ , is used in lab for staining neurons. What is the percentage of each element in silver chromate?

First, find the molar mass of  $\text{Ag}_2\text{CrO}_4$ :

$$\begin{array}{r} 2 \text{ Ag} \quad 2(107.9) = 215.8 \\ 1 \text{ Cr} \quad 1(51.996) = 51.996 \\ 4 \text{ O} \quad 4(16.00) = 64.00 \\ \hline 331.796 \end{array}$$

Now, convert each to percent composition:

$$\text{Ag: } \frac{215.8 \text{ g}}{331.796 \text{ g}} \times 100\% = 65.04\% \text{ Ag}$$

$$\text{Cr: } \frac{51.99 \text{ g}}{331.796 \text{ g}} \times 100\% = 15.67\% \text{ O}$$

$$\text{O: } \frac{64.00 \text{ g}}{331.796 \text{ g}} \times 100\% = 19.29\% \text{ O}$$

Check: all percents should add to 100%  
 $65.04 + 15.67 + 19.29 = 100.00$

Dr. Sapna Gupta/Mass Percents

5

**Solved Problem: Gram of an element in gram of compound**

The chemical name of table sugar is sucrose,  $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ . How many grams of oxygen are in 68.1 g of sucrose?

First, find the molar mass of  $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ :

$$\begin{array}{r} 12 \text{ C} \quad 12(12.01) = 144.12 \\ 11 \text{ O} \quad 11(16.00) = 176.00 \\ 22 \text{ H} \quad 22(1.008) = 22.176 \\ \hline 342.296 \text{ g/mol} \end{array}$$

Now, find the mass of carbon in 68.1 g sucrose:

$$68.1 \text{ g sucrose} \times \frac{176.00 \text{ g oxygen}}{342.30 \text{ g sucrose}} = 35.01 \text{ g oxygen}$$

Dr. Sapna Gupta/Mass Percents

6

6

**Solved Problem: Percent water in a hydrate**

What is the percent water in copper(II) sulfate pentahydrate,  $\text{CuSO}_4 \cdot 5 \text{H}_2\text{O}$ ?

1 Cu	(1)63.55 g = 63.55 g	
1 S	(1)32.07 g = 32.07 g	2 H (2)1.01 = 2.02 g
4 O	(4)16.00 g = 64.00 g	<u>1 O (1)16.00 = 16.00 g</u>
	159.62 g/mol	18.02 g/mol

Formula Mass of hydrate =  $159.62 + 5(18.02) = 249.72 \text{ g/mol}$

Divide the mass of water in one mole of the hydrate by the molar mass of the hydrate and multiply this fraction by 100.

$$\text{percent hydrate} = \frac{(5 \times 18.02)}{249.72} \times 100\% = 36.08\% \text{ H}_2\text{O}$$

Dr. Sapna Gupta/Mass Percents

7

7

## Empirical Formulas

*Refer to the first couple to see the three formulas: empirical, molecular and structural.*

The empirical formula of a substance written with the smallest integer subscripts.

The empirical formula for the molecular formula  $\text{N}_2\text{O}_4$  is  $\text{NO}_2$ . (Divide both 2 and 4 by 2)

If an empirical formula is HO then the entire formula (each atom) has to be multiplied by 2 to find the molecular formula of hydrogen peroxide  $\text{H}_2\text{O}_2$ .

How do we get the empirical formula? By using elemental analysis (combustion reaction) in the lab.

How do we get the integer 2 to multiply with? This is found by mass spectrophotometer in the lab. This instruments find the mass of a substance.

Dr. Sapna Gupta/Mass Percents

8

8

## Elemental Analysis

- Below shows the apparatus used for elemental analysis of a substance. Elements such as C, H, N, S and sometimes O can be analysed.

- The sample is burned in oxygen (combustion reaction) and the products, carbon dioxide and water and other oxides are collected separately and weighed.
- The mass of the oxides are then used to calculate the weight of the element (not oxygen). This can be used to calculate the empirical formula of the compound.

Dr. Sapna Gupta/Mass Percents

9

9

## Determining Empirical Formula

Generally, you will be given percents of each of the element in the formula.

- Convert the percent to 100 g of the substance. (e.g. 39% C = 39 g C)
- Convert grams to moles for each element.
- Create the molecular formula using these moles.
- Divide each mole amount by the smallest mole amount to get mol ratio. Now you can round off numbers.

### **How to Round off**

- When rounding off mol ratios, 1.99 or 1.89 can be rounded to 2, but 1.49 cannot be rounded to 2 or 1.
- In case of certain decimal points the mole has to be multiplied by an integer to make whole numbers as shown below.

### **For example:**

- If the decimal portion is 0.5, multiply by 2.
- If the decimal portion is 0.33 or 0.67, multiply by 3.
- If the decimal portion is 0.25 or 0.75, multiply by 4.

Dr. Sapna Gupta/Mass Percents

10

10

## Determining Molecular Formula

Molecular formula is the actual ratio of elements.

- To get the molecular formula you need to know the molecular mass of the compound. This will be given to you.
- Find the molecular weight of the empirical formula.
- Divide the molecular weight by the mass of the empirical formula. Multiply the empirical formula with that number (n) obtained.

Dr. Sapna Gupta/Mass Percents

11

11

### **Solved Example: Molecular formula from empirical formula**

A compound has an empirical formula of CH. The molecular mass was found to be 52.08 g/mol. What is the molecular formula of this compound?

Empirical Formula CH weight = C + H = 12.01 + 1.008 = 13.018 g/mol

$$\frac{\text{Molecular weight}}{\text{Empirical formula weight}} = n = \frac{52.08}{13.018} = 4$$

Molecular formula = (CH) × 4 =  $\text{C}_4\text{H}_4$

Dr. Sapna Gupta/Mass Percents

12

12

**Solved Problem: Calculating empirical formula**

Sodium pyrophosphate is used in detergent preparations. It is composed of 34.5% Na, 23.3% P, and 42.1% O. What is its empirical formula?

**Step 1: Convert all percents to grams and find mols of each element**

$$34.5 \text{ g Na} \times \frac{1 \text{ mol Na}}{22.99 \text{ g Na}} = 1.501 \text{ mol Na}$$

$$23.3 \text{ g P} \times \frac{1 \text{ mol P}}{30.97 \text{ g P}} = 0.7523 \text{ mol P}$$

$$42.1 \text{ g O} \times \frac{1 \text{ mol O}}{16.00 \text{ g O}} = 2.631 \text{ mol O}$$

**Step 2: Divide all mols by the smallest mols found in step 1**

$$\frac{1.501 \text{ mol Na}}{0.7523} = 2.00 \quad \times 2 = 4$$

$$\frac{0.7523 \text{ mol P}}{0.7523} = 1.00 \quad \times 2 = 2$$

$$\frac{2.631 \text{ mol O}}{0.7523} = 3.50 \quad \times 2 = 7$$

*Step 3: Multiply all mols by 2 because O is 3.5.*

Empirical formula  
 $\text{Na}_4\text{P}_2\text{O}_7$

Dr. Sapna Gupta/Mass Percents

13

13

**Solved Problem: Empirical and molecular formula**

Benzene is composed of 92.3% carbon and 7.7% hydrogen. What is the empirical formula of benzene? Its molecular weight is 78.1 amu. What is its molecular formula?

**Step 1**

$$92.3 \text{ g C} \times \frac{1 \text{ mol C}}{12.01 \text{ g C}} = 7.685 \text{ mol C}$$

$$7.7 \text{ g H} \times \frac{1 \text{ mol H}}{1.008 \text{ g H}} = 7.64 \text{ mol H}$$

**Step 2**

$$\frac{7.685}{7.64} = 1$$

$$\frac{7.64}{7.64} = 1$$

Empirical formula: CH

**Step 3**

$$\frac{\text{Empirical formula weight} = 13.02 \text{ amu}}{\text{Molecular weight}} = n = \frac{78.1}{13.02} = 6$$

Molecular formula:  $\text{C}_6\text{H}_6$

$$\text{Molecular formula} = (\text{CH}) \times n = (\text{CH}) \times 6 = \text{C}_6\text{H}_6$$

Dr. Sapna Gupta/Mass Percents

14

14

**Solved Problem: Empirical and molecular formula**

Hexamethylene is one of the materials used to produce a type of nylon. It is composed of 62.1% C, 13.8% H, and 24.1% N. Its molecular weight is 116 amu. What is its molecular formula?

**Step 1**

$$62.1 \text{ g C} \times \frac{1 \text{ mol C}}{12.01 \text{ g C}} = 5.171 \text{ mol C}$$

$$13.8 \text{ g H} \times \frac{1 \text{ mol H}}{1.008 \text{ g H}} = 13.69 \text{ mol H}$$

$$24.1 \text{ g N} \times \frac{1 \text{ mol N}}{14.01 \text{ g N}} = 1.720 \text{ mol N}$$

**Step 2**

$$\text{mol C} \frac{5.171}{1.720} = 3$$

$$\text{mol H} \frac{13.69}{1.720} = 8$$

$$\text{mol N} \frac{1.720}{1.720} = 1$$

Empirical  
formula  
 $\text{C}_3\text{H}_8\text{N}$

**Step 3**

Molecular weight of the empirical formula  $\text{C}_3\text{H}_8\text{N}$ .

$$3(12.01) + 8(1.008) + 1(14.01) = 58.104 \text{ amu}$$

$$n = \frac{116}{58.10} = 2$$

$$\text{Molecular formula} = (\text{C}_3\text{H}_8\text{N} \times 2) = \text{C}_6\text{H}_{16}\text{N}_2$$
